

ABSTRACT

A remote control is configured by a user specifying a type and brand of a consumer electronic device. A plurality of function code sets that have been identified as being candidates for commanding operations of the specified type and brand of consumer electronic device are selected and at least a subset of each of the plurality of selected function code sets is made available such that a user may determine by experimentation which one of the plurality of function code sets is appropriate for commanding operations of the specified type and brand of consumer electronic device.
